PCOS is yet another reason for infertility in women. PCOS and infertility are like synonymous in more than 5% cases. The disorder affects mostly, the women who are in their puberty age.

This decreased level can be self verified by differentiation in breast size. Progesterone is considered to be the stabilizer for the growth of fetus. If you have had miscarriage in the past or have been addressing the above mentioned symptoms, consult a doctor immediately. You will be tested for the level of this hormone in your blood or your menstrual secretion. Deficiency of the hormone in the body can be dealt with hormonal pills. In case of excessively decreased level of the hormone, it can even be injected in your body. This will not only enhance the level already present, but will also contribute to its production, thereafter.
